PERSONAL PROJECTS

Clipix-lite

- This is my final year project, developed using Flutter. The aim of this app is to provide users with a centralized platform to securely store and organize their important documents, texts, locations, recordings, images, and videos. To achieve this, I incorporated several key technologies and features, including:
- **Firebase Integration:** Firebase for secure user authentication and data storage.
- **Location Tracking with Google Maps:** Google Maps helps users save the location of a particular place.
- **QR Code Scanner:** Integration of a barcode scanner, allowing users to quickly scan QR codes for efficient data input and retrieval.
- **Voice Recording:** This app also features a voice recorder, enabling users to save audio recordings securely alongside their other data.
- **Localization:** To enhance user accessibility, I've incorporated localization capabilities, making it possible to translate the app into different languages.

Chat-App

- Real-time chat application leveraging Firestore for message storage and Firebase Authentication for user Authentication and management.

Todo-App

- Developed a TodoApp using state management technique with Provider and local data storage with SQLite.
- The application allows you to create a task list along with viewing done tasks by storing them locally on the device.
